Above please note the Toombs County Tax Assessor's land value schedule for rural properties. A list of surrounding counties has also been included for your easy review and comparison.

The customary test of fair market value in real estate transactions is the price that a buyer is willing, but not under any duty, to pay for a particular property to an owner who is willing, but not obligated, to sell. The Board of Assessors is called upon to extrapolate from these fair market sales a schedule to apply to all rural property.

A common way to accomplish this is to classify parcels by their soil type. The United States Department of Agriculture's Soil Conservation Agency classifies the productivity of soil and provides maps of these soil types. The Board of Assessors takes a parcel map and overlays it with a soil type map to determine how many acres of each type of soil make up each parcel. The Board of Assessors then must determine the value per acre of each soil type.

The Board of Assessors determines the "going rate," or fair market value for each soil type through benchmark sales. The perfect "benchmark" would be a large parcel with only one soil type. As we all know, that rarely, if ever, happens. The assessors then look for parcels that contain the fewest soil types, i.e. "close to perfect." By comparing these parcels and the types of soil they contain, the Board of Assessors is most closely able to ascertain the fair market value per acre of each soil type. Consideration is also given to open land, woodlands, location, and tract size.

Once the rural land schedule is derived, the Board of Assessors compares their values with those derived from other counties as a check on their process. Lastly, the Board of Assessors determines the per acre average of all rural property sales from the previous year and ensures that all soil classifications are equal to or below this figure.
